

The program *Book Quest* Feedback:

Pros:

- Beautiful colors
- Good animation
- Allows the player/user to think outside the box
- Allows combinations of different choices

Cons:

- Does not yet have an end goal in sight.
- It's not clear how the user got to where they are.
- It's not clear if there's real consequences; if you choose wrong it has no real effects because no end goal in sight.
- It's not clear whether or not there are right answers to the riddles; I haven't done any right riddle answers so idk. It's fine if it's just because I got it wrong but I don't know if it's that or not.
- It seems like it doesn't save your progress, which is important especially if the playthrough takes more than a few minutes
- Sometimes it seems like there are also no wrong answers for the puzzles--unless you're doing the riddles. Then idk.

Future plans going forward, this is what I'm thinking would be some good additions:

- It would be interesting if the animations were moving instead of panel to panel scenes. Or maybe we could do it a bit like an escape game in which we can see different areas of the room at a time and things move if you interact with them.
- I think the game should have end goals in sight, but not a complete ending *yet*. I'm thinking the way the user responds to the puzzles might be a clue as to what books suit them best. Are they cautious? Then they might appreciate someone as careful as Bilbo Baggins, as opposed to someone as rash as Thor. Do they attempt to talk or fight with the treasure guardians? If fight → Books where the protagonist deals more with physical combat. If conversation → Complex villain characters, possibly.
- The game should not take so long in one playthrough that the user plays it *instead of* reading a book. It should have a relatively short playthrough (less than an hour at most, perhaps?) before they reach the book recommendation. Then their save file could go through a cooldown period until the user has finished reading the book and/or has feedback about said recommendation. Maybe if they finished the book they type in the last sentence or something to unlock the next playthrough. Maybe if the book just really didn't suit them the game unlocks anyway after the user gives specific feedback that the

program files away for future reference for book recommendations for this reader as well as readers in general.

- It would be cool if the user had a place to call home in the game. Yes, it's a book recommendations app but maybe they could also have a home that has bookshelves that get updated with the books they've read like an animated bookshelf to keep track. Also this way it could save their progress in different genres.
- Maybe there should be right answers but the reader gets rewards based on their more extensive answers?
